Sample Exercise and Solution Breakdown

To illustrate the effectiveness of Jun Shao's solutions, consider a typical exercise on maximum likelihood estimation (MLE):

Exercise

Suppose $(X_1, X_2, \dots, X_n)$ are independent and identically distributed random variables from a normal distribution $N(\mu, \sigma^2)$, where σ^2 is known. Derive the maximum likelihood estimator for μ .

Solution Outline

- Write down the likelihood function:

- $L(\mu) = \prod_{i=1}^n \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{(X_i - \mu)^2}{2\sigma^2}\right)$.

- Take the natural logarithm to obtain the log-likelihood:

- $\ell(\mu) = -\frac{n}{2} \log(2\pi\sigma^2) - \frac{1}{2\sigma^2} \sum_{i=1}^n (X_i - \mu)^2$.

- Differentiate $\ell(\mu)$ with respect to μ :

- $\frac{d}{d\mu} \ell(\mu) = \frac{1}{\sigma^2} \sum_{i=1}^n (X_i - \mu)$.

- Set the derivative equal to zero and solve:

- $\sum_{i=1}^n (X_i - \mu) = 0 \Rightarrow \hat{\mu} = \frac{1}{n} \sum_{i=1}^n X_i$.

- Conclude that the MLE for μ is the sample mean.

This example demonstrates Shao's clear, logical approach, guiding students through each step to reinforce understanding of MLE derivation in the normal model.

- Identify what is being asked: proof, derivation, computation, or conceptual explanation.
- Note the assumptions and conditions provided.

Step 2: Recall Relevant Theoretical Results

- Map the problem to known theorems or lemmas.
- For example, if the problem involves asymptotic normality, recall the CLT or Lyapunov's condition.

Step 3: Break Down the Problem into Subparts

- Simplify complex problems by dividing them into manageable parts.
- For example, to prove consistency, verify the conditions of a relevant theorem (e.g., the Law of Large Numbers).

- Use algebraic manipulations, inequalities, and limit arguments.
- Be meticulous with assumptions about convergence (almost sure, in probability, in distribution).

Step 5: Verify Conditions and Justify Each Step

- Ensure all conditions (e.g., independence, identical distribution, boundedness) are satisfied.
- Justify the use of each theorem or inequality.

Step 6: Summarize the Result Clearly

- State the conclusion explicitly.
- Connect it back to the original question.

Illustrative Examples and Solutions

Let's explore some common exercise types inspired by Jun Shao's work, along with detailed solution strategies.

Example 1: Asymptotic Normality of the MLE

Problem: Suppose $(X_1, X_2, \dots, X_n)$ are i.i.d. random variables with a density $f(x; \theta)$, where θ is an unknown parameter. Show that under regularity conditions, the maximum likelihood estimator $\hat{\theta}_n$ is asymptotically normal:

$$\sqrt{n}(\hat{\theta}_n - \theta_0) \xrightarrow{d} N(0, I(\theta_0)^{-1}),$$

]

where $I(\theta_0)$ is the Fisher information.

Solution Outline:

- Step 1: Recall the regularity conditions for MLE asymptotics (differentiability, identifiability, Fisher information positivity).

- Step 2: Recognize that the MLE solves the score equation:

$$\frac{1}{n} \sum_{i=1}^n \frac{\partial}{\partial \theta} \log f(X_i; \theta) = 0.$$

- Step 3: Use Taylor expansion of the score function around θ_0 :

$$0 = \frac{1}{n} \sum_{i=1}^n \frac{\partial}{\partial \theta} \log f(X_i; \hat{\theta}_n) \approx \frac{1}{n} \sum_{i=1}^n \frac{\partial}{\partial \theta} \log f(X_i; \theta_0) + \left(\hat{\theta}_n - \theta_0 \right) \frac{1}{n} \sum_{i=1}^n \frac{\partial^2}{\partial \theta^2} \log f(X_i; \tilde{\theta}),$$

where $\tilde{\theta}$ is between $\hat{\theta}_n$ and θ_0 .

- Step 4: Show that the score function converges in distribution to a normal distribution via the CLT, and the second derivative converges in probability to $-I(\theta_0)$.

- Step 5: Rearrange the terms to obtain the asymptotic distribution:

$$\sqrt{n}(\hat{\theta}_n - \theta_0) \xrightarrow{d} N(0, I(\theta_0)^{-1}).$$

Example 2: Consistency of the Sample Mean

Problem: Prove that the sample mean $\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i$ is a consistent estimator for $\mu = E[X_i]$.

Solution Strategy:

- Step 1: Verify conditions for the Law of Large Numbers:
 - Independence (assumed).
 - Finite expectation $E[X_i]$
- Step 2: Apply the Strong Law of Large Numbers (SLLN):

$\bar{X}_n \xrightarrow{\text{a.s.}} \mu.$

]

- Step 3: Alternatively, use the Weak Law of Large Numbers for convergence in probability:

$\bar{X}_n \xrightarrow{p} \mu.$

]

- Step 4: Conclude that $\bar{X}_n$ is a consistent estimator of μ .
