Question:

What is the role of the mitochondria in a cell?

Answer:

The mitochondria are known as the powerhouses of the cell because they generate most of the cell's supply of adenosine triphosphate (ATP), which is used as a source of chemical energy. They facilitate cellular respiration by converting glucose and oxygen into ATP, carbon dioxide, and water. The process involves several steps, including glycolysis, the Krebs cycle, and the electron transport chain. Mitochondria also play roles in regulating cellular metabolism, signaling, and apoptosis (programmed cell death). Their structure, characterized by a double membrane and inner folds called cristae, optimizes energy production.
