Components Included in the Plans

Understanding the core components of the tire hammer is crucial before beginning construction:

Base Frame

Provides stability and support for the entire machine. Typically made from steel or heavy-duty metal beams, the base anchors the machine securely to prevent movement during operation.

Arm or Ram

The swinging component that delivers the blow. It is connected to the drive system and must be balanced for smooth operation.

Drive System

Usually powered by a motor connected via belts or chains, this system rotates the arm or reciprocates it to generate the hammer's impact.

Tire or Flywheel

A large, heavy tire or wheel that stores rotational energy, providing smooth and consistent hammer blows. Clay Spencer's plans often specify how to repurpose or source suitable tires.

Linkages and Bearings

Components that allow for smooth movement of the arm and support rotation. Proper lubrication and alignment are vital for longevity and performance.

Control Mechanisms

Includes switches, safety features, and possibly adjustable components to control the hammer's operation.

Steps to Build a Tire Hammer Using Clay Spencer Plans

Constructing a tire hammer involves multiple stages, from planning to assembly. Below is an overview of the general process:

1. Gather Materials and Tools

Preparation is critical. Common materials include:
