Pogil Chemistry Answer Key for Gas Variables

Understanding the behavior of gases is fundamental in chemistry, and the Pogil (Process Oriented Guided Inquiry Learning) approach provides an engaging way for students to explore this topic. The Pogil Chemistry Answer Key for Gas Variables serves as a valuable resource for educators and students alike, offering clear explanations and solutions related to the key variables that describe gases. This guide will delve into the core concepts of gas variables, their relationships, and provide detailed answers to common Pogil activities centered on this topic.

Introduction to Gas Variables

Gases are characterized by several variables that describe their state and behavior. These variables include pressure, volume, temperature, and amount (moles). Understanding the relationships among these variables is essential for grasping the principles of gas laws.

Key Gas Variables

- **Pressure (P):** The force exerted by gas particles per unit area on the walls of their container, typically measured in atmospheres (atm), pascals (Pa), or millimeters of mercury (mm Hg).
- **Volume (V):** The space occupied by the gas, measured in liters (L) or cubic meters (m³).
- **Temperature (T):** The measure of the average kinetic energy of gas particles, measured in Kelvin (K).
- **Amount (n):** The number of moles of gas present, measured in moles (mol).

The Gas Laws and Their Variables

The behavior of gases under various conditions is described mathematically by several gas laws. The Pogil activities often explore these laws through inquiry-based questions and answer keys.

Boyle's Law

Boyle's Law states that for a fixed amount of gas at constant temperature, the pressure and volume are inversely proportional:

$$P_1V_1 = P_2V_2$$

- **Implication:** Increasing pressure decreases volume, and vice versa, provided temperature and moles stay constant.

Charles's Law

Charles's Law describes the direct relationship between volume and temperature at constant pressure:

$$V_1 / T_1 = V_2 / T_2$$

- **Implication:** As temperature increases, volume increases proportionally when pressure and moles are constant.

Gay-Lussac's Law

This law relates pressure and temperature at constant volume:

$$P_1 / T_1 = P_2 / T_2$$

- **Implication:** Increasing temperature results in increased pressure, assuming volume and moles are constant.

Combined Gas Law

The combined law integrates Boyle's, Charles's, and Gay-Lussac's laws:

$$(P_1 V_1) / T_1 = (P_2 V_2) / T_2$$

Ideal Gas Law

The most comprehensive law, combining all variables:

$$PV = nRT$$

- **Where:** R is the ideal gas constant (8.314 J/(mol·K)).

- **Implication:** Allows calculation of any one variable if the others are known.

Common Pogil Activities and Answer Key Insights

Pogil activities often involve practical scenarios where students apply the gas laws to solve problems. Here are some typical questions and detailed answer explanations.

Activity 1: Calculating Final Pressure

Question:

A gas sample occupies 10.0 L at a pressure of 1.00 atm and a temperature of 300 K. If the volume is decreased to 5.00 L at constant temperature, what is the new pressure?

Answer:

Using Boyle's Law:

$$P_1V_1 = P_2V_2$$

Plugging in values:

$$(1.00 \text{ atm})(10.0 \text{ L}) = P_2 (5.00 \text{ L})$$

Solving for P_2 :

$$P_2 = (1.00 \text{ atm})(10.0 \text{ L}) / 5.00 \text{ L} = 2.00 \text{ atm}$$

Conclusion:

The new pressure is 2.00 atm.

Activity 2: Determining Final Temperature

Question:

A 2.0 mol sample of gas occupies 20.0 L at 300 K. If the volume expands to 40.0 L at constant pressure, what is the new temperature?

Answer:

Using Charles's Law:

$$V_1 / T_1 = V_2 / T_2$$

Rearranged:

$$T_2 = V_2 \times T_1 / V_1$$

Substitute known values:

$$T_2 = (40.0 \text{ L})(300 \text{ K}) / 20.0 \text{ L} = 600 \text{ K}$$

Conclusion:

The temperature increases to 600 K during the expansion.

Activity 3: Calculating Moles of Gas

Question:

A container has a pressure of 1.50 atm, volume of 5.00 L, and temperature of 273 K. How many moles of gas are present?

Answer:

Using the Ideal Gas Law:

$$PV = nRT$$

Rearranged to solve for n:

$$n = PV / RT$$

Substitute known values:

$$n = (1.50 \text{ atm})(5.00 \text{ L}) / (0.0821 \text{ L}\cdot\text{atm}/(\text{mol}\cdot\text{K}) \times 273 \text{ K})$$

Calculate denominator:

$$0.0821 \times 273 = 22.43$$

Calculate numerator:

$$1.50 \times 5.00 = 7.50$$

Finally:

$$n = 7.50 / 22.43 = 0.334 \text{ mol}$$

Conclusion:

Approximately 0.334 moles of gas are present.

These variables are interconnected through a series of fundamental gas laws, forming the foundation of gas behavior analysis.

Why Are Gas Variables Important?

Understanding these variables and their relationships allows chemists to predict how gases will respond to different conditions. This has applications in:

- Industrial processes
- Respiratory physiology
- Environmental science
- Engineering

Key Gas Laws and Their Variables

The behavior of gases is described mathematically by several key laws. The POGIL chemistry answer key emphasizes understanding these relationships to solve problems effectively.

Boyle's Law (Pressure-Volume Relationship)

- Statement: For a fixed amount of gas at constant temperature, the pressure and volume are inversely proportional.
- Mathematical Expression: $P_1V_1 = P_2V_2$
- Implication: Increasing pressure decreases volume, and vice versa, assuming temperature and moles are constant.

Charles's Law (Temperature-Volume Relationship)

- Statement: For a fixed amount of gas at constant pressure, the volume is directly proportional to temperature.
- Mathematical Expression: $V_1/T_1 = V_2/T_2$
- Implication: Heating a gas causes it to expand; cooling causes contraction.

Gay-Lussac's Law (Pressure-Temperature Relationship)

- Statement: For a fixed amount of gas at constant volume, pressure is directly proportional to temperature.

- Mathematical Expression: $P \propto T$ or $P/T = \text{constant}$

- Implication: Increasing temperature increases pressure if volume remains unchanged.

Avogadro's Law (Volume-Amount Relationship)

- Statement: Equal volumes of gases at the same temperature and pressure contain equal moles.

- Mathematical Expression: $V \propto n$ or $V/n = \text{constant}$

- Implication: Increasing the number of moles increases volume proportionally.

The Ideal Gas Law: The Fundamental Equation

The POGIL chemistry answer key frequently emphasizes the ideal gas law as the unifying principle:

$$PV = nRT$$

Where:

- P: Pressure

- V: Volume

- n: Moles of gas

- R: Ideal gas constant (8.314 J/(mol·K) or 0.0821 L·atm/(mol·K))

Common Types of Gas Variable Problems and How to Approach Them

Problem Type 1: Calculating Final Pressure, Volume, or Temperature

Example: If a 2.0 L container of gas at 300 K and 1 atm pressure is compressed to 1.0 L at the same temperature, what is the new pressure?

Approach:

- Recognize Boyle's Law applies.
- Use $P_1V_1 = P_2V_2$.

- Substitute known values: $(1 \text{ atm})(2.0 \text{ L}) = P?(1.0 \text{ L})$.
- Solve for $P?$: $P? = (1 \text{ atm})(2.0 \text{ L})/1.0 \text{ L} = 2 \text{ atm}$.

Problem Type 2: Determining the Temperature Needed for a Certain Volume Change

Example: How hot must a gas be heated from 300 K to expand from 1.0 L to 2.0 L at constant pressure?

Approach:

- Use Charles's Law: $V?/T? = V/T$.
- Rearrange: $T? = V? \times T / V$.
- Calculate: $T? = (2.0 \text{ L})(300 \text{ K}) / 1.0 \text{ L} = 600 \text{ K}$.

Problem Type 3: Calculating Moles of Gas

Example: How many moles are present in a 10.0 L container at 2.0 atm and 300 K?

Approach:

- Use the ideal gas law: $n = PV / RT$.
- Substitute: $n = (2.0 \text{ atm})(10.0 \text{ L}) / (0.0821 \text{ L}\cdot\text{atm}/(\text{mol}\cdot\text{K}))(300 \text{ K})$.
- Calculate: $n \approx 0.81 \text{ mol}$.

Question Answer What are the main gas variables discussed in Pogil Chemistry related to gases? The main gas variables discussed in Pogil Chemistry are pressure (P), volume (V), temperature (T), and amount in moles (n). How does Boyle's Law relate to gas variables in Pogil Chemistry? Boyle's Law states that at constant temperature and moles, the pressure of a gas is inversely proportional to its volume ($P_1V_1 = P_2V_2$). What is the significance of the ideal gas law in understanding gas variables? The ideal gas law ($PV = nRT$) combines all the gas variables, allowing us to predict how pressure, volume, temperature, and moles of a gas interact under different conditions. How does temperature affect the pressure of a gas at constant volume? According to Gay-Lussac's Law, at constant volume and moles, increasing temperature increases pressure ($P_1/T_1 = P_2/T_2$). What happens to the volume of a gas when pressure increases at constant temperature? The volume decreases when pressure increases at constant temperature, as described by Boyle's Law. Why is the ideal gas law useful in solving problems involving gas variables? It provides a comprehensive equation that relates pressure, volume, temperature, and moles, enabling calculations of unknown variables under various conditions. How do changes in moles of gas affect pressure at constant volume and temperature? Increasing the moles of gas increases the pressure, as per the direct relationship in the ideal gas law ($PV = nRT$). What is the role of the gas constant (R) in the ideal gas law? The gas constant (R) links the energy units in the ideal gas law and allows calculations to be consistent across different units and conditions.
