## Sample Practice Question and Explanation

Question:

A lever with a fulcrum is used to lift a load of 200 pounds. To lift the load, a force of 50 pounds is applied at a distance of 4 feet from the fulcrum. What is the mechanical advantage of this lever?

Options:

- a) 2
- b) 4
- c) 8
- d) 16

Solution:

Mechanical advantage (MA) = Load / Effort = Distance from fulcrum to effort / Distance from fulcrum to load

Since effort is applied 4 feet from the fulcrum, and the load is 200 pounds, the effort needed is 50 pounds at 4 feet.

Alternatively, the lever's mechanical advantage is proportional to the ratio of distances:

$$\text{MA} = \frac{\text{Distance effort}}{\text{Distance load}}$$

If effort is applied at 4 ft, and the load is at some distance (unknown) from the fulcrum, but given the

effort and load, the ideal mechanical advantage can be calculated as:

$$\text{MA} = \frac{\text{Load}}{\text{Effort}} = \frac{200}{50} = 4$$

Answer: b) 4

This question demonstrates how to analyze lever systems and perform simple calculations, a typical component of the Ramsey mechanical aptitude test.
