Sample Question and Model Answer: Water Salinity Analysis

Question:

Given the following data from a water sample:

- Conductivity: 45 mS/cm
- Temperature: 20°C

Calculate the salinity of the water sample.

Model Answer:

To calculate salinity from conductivity, we can use the practical salinity scale or a conversion factor.

- Convert conductivity to Practical Salinity (SP):
- At 20°C, the approximate relation is:

$$SP \approx \text{Conductivity (mS/cm)} \times 1.806$$

- Therefore, $SP \approx 45 \times 1.806 = 81.27$
- Convert Practical Salinity to PSU (practical salinity units):
- Since SP is approximately equal to PSU, salinity ≈ 81.27 PSU (parts per thousand).
- Final Answer:

- The water sample has a salinity of approximately 81.27 PSU, indicating highly saline conditions typical of seawater.

Note:

Actual calculations may require calibration curves or specific formulas depending on the equipment used.
