- Distribution Systems: Control water flow and distribution.
- Field Channels: Deliver water to individual fields.

- Hydraulic Design of Canals

The design involves calculations for flow velocity, cross-sectional area, and slope to ensure efficient conveyance without excessive erosion or sedimentation.

Key considerations:

- Discharge (Q): Volume of water flowing per second.
- Velocity (V): Speed of water flow.

- Cross-Sectional Area (A): Cross-sectional size of the canal.
- Gradient or Slope: Determines flow velocity.

Water Power: Harnessing Hydroelectric Energy

$$H = z + v^2 / 2g$$

where:

- z = elevation head
- v = velocity of water
