Sample Cardiac Surgery MCQs with Answers

1. Which of the following is the most common indication for coronary artery

bypass grafting (CABG)?

- Severe aortic stenosis
- Multi-vessel coronary artery disease
- Atrial fibrillation
- Mitral regurgitation

Answer: 2. Multi-vessel coronary artery disease

4. Which of the following is a contraindication for mechanical heart valve

replacement?

- History of bleeding disorders
- Young age
- Presence of atrial fibrillation

Sample MCQs with Answers and Explanations

To illustrate the utility of these MCQ resources, below are some sample questions spanning different topics.

Question 1: Coronary Artery Bypass Grafting (CABG)

Which of the following grafts is most commonly used for CABG?

- A) Saphenous vein
- B) Internal mammary artery
- C) Radial artery
- D) Femoral artery

Correct Answer: B) Internal mammary artery

Explanation:

The internal mammary (thoracic) artery is preferred due to its superior long-term patency rates and resistance to atherosclerosis. While saphenous veins are commonly used, they have lower long-term success. Radial arteries are also used but less frequently as a primary graft. Femoral arteries are typically not used as grafts in coronary bypass surgery.

Question 2: Valve Replacement

Which type of prosthetic valve is associated with the highest risk of thromboembolism if anticoagulation is not maintained?

- A) Mechanical valve
- B) Bioprosthetic valve
- C) Homograft valve
- D) Autograft valve

Correct Answer: A) Mechanical valve

Explanation:

Mechanical valves are durable but require lifelong anticoagulation due to their thrombogenic nature. Without proper anticoagulation, they pose a high risk of thromboembolism. Bioprosthetic valves have lower thrombogenicity but tend to degenerate faster.

Question 3: Congenital Heart Disease

In which congenital defect is a "hole in the atrial septum" most characteristic?

- A) Ventricular septal defect
- B) Atrial septal defect
- C) Patent ductus arteriosus
- D) Tetralogy of Fallot

Correct Answer: B) Atrial septal defect

Explanation:

An atrial septal defect (ASD) involves an abnormal opening in the atrial septum, leading to left-to-right shunting of blood. VSD involves a ventricular septal opening, PDA involves abnormal ductus arteriosus, and Tetralogy of Fallot is characterized by multiple defects including VSD and pulmonary stenosis.
