Introduction to Feedback Control Systems by Barapate

What are Feedback Control Systems?

Feedback control systems are mechanisms that automatically adjust their operation to achieve desired outputs by continuously comparing the actual output with a reference value. The fundamental principle involves feeding a portion of the output signal back into the input to correct deviations and stabilize the system. This process ensures that the system maintains desired performance levels despite external disturbances or internal variations.

Components of Feedback Control Systems

A typical feedback control system comprises several essential components:

- **Plant:** The system or process to be controlled (e.g., motor, temperature system).
- **Controller:** The device that computes the control signal based on the error (difference between

desired and actual output).

- **Sensors:** Devices that measure the output or state of the plant.
