- A reaction that releases heat into the surroundings.
- A reaction that occurs at constant temperature.
- A reaction with a positive ΔH .

Answer: Option 2 ? A reaction that releases heat into the surroundings.

Problem 2: Calculating Enthalpy Change

Given that the combustion of 1 mol of methane (CH_4) releases 890 kJ of energy, what is the enthalpy change (ΔH) when 0.5 mol of methane is burned?

Solution:

\[

$$\Delta H = \text{moles} \times \text{per mol energy} = 0.5 \text{ mol} \times (-890 \text{ kJ/mol}) = -445$$

\text{ kJ}

\]

Answer: -445 kJ

Problem 3: Applying Hess's Law

Given the following data:

- ΔH° for reaction $A \rightarrow B = -100 \text{ kJ}$

- ΔH° for reaction $B \rightarrow C = +50 \text{ kJ}$

Calculate ΔH° for reaction $A \rightarrow C$.

Solution:

\[

$$\Delta H^\circ_{\{A \rightarrow C\}} = \Delta H^\circ_{\{A \rightarrow B\}} + \Delta H^\circ_{\{B \rightarrow C\}} = -100 + 50 = -50 \text{ kJ}$$

\]

Answer: -50 kJ

Problem 4: Interpreting Calorimetry Data

A 50 g sample of a substance is heated in a calorimeter, raising its temperature by 10°C . The calorimeter measures 200 J of heat absorbed. What is the specific heat capacity (c) of the substance?

Solution:

\[

$$q = mc\Delta T \rightarrow c = \frac{q}{m\Delta T} = \frac{200 \text{ J}}{50 \text{ g} \times 10^\circ\text{C}} = \frac{200}{500} = 0.4 \text{ J/g}^\circ\text{C}$$

\]

Answer: 0.4 J/g°C

Sample Practice Problem and Solution

Question:

A 50.0 g sample of ice at 0°C is heated until it melts and then warmed to 20°C. The heat of fusion for ice is 6.00 kJ/mol, and the specific heat capacity of liquid water is 4.18 J/g°C. What is the total heat absorbed during this process?

- A) 334 J
- B) 502 J
- C) 1250 J
- D) 1500 J

Solution:

- Calculate moles of ice:

Molar mass of water ? 18. g/mol

Moles of ice = 50.0 g / 18. g/mol ? 2.78 mol

- Heat to melt ice (fusion):

$$Q_1 = ?H_f \times \text{moles} = 6.00 \text{ kJ/mol} \times 2.78 \text{ mol} = 16.7 \text{ kJ} = 16,700 \text{ J}$$

- Heat to warm water from 0°C to 20°C:

$$Q_2 = \text{mass} \times \text{specific heat} \times \text{temperature change}$$

$$Q_2 = 50.0 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C} \times 20^\circ\text{C} = 50.0 \times 4.18 \times 20 = 4180 \text{ J}$$

- Total heat absorbed:

$$Q_{\text{total}} = Q_1 + Q_2 = 16,700 \text{ J} + 4180 \text{ J} = 20,880 \text{ J}$$

Answer:

None of the options exactly match, but if the options are approximate, D) 1500 J is too low, B) 502 J is too low, C) 1250 J is too low, and A) 334 J is too low. Given the calculations, the closest approximate value is about 21,000 J, indicating a potential typo in options or a need for units.

Note: The question should have options around 20,000 J for accuracy, but as per this calculation, the process demonstrates how to approach such problems.

Using Practice Problems for Effective Learning

To maximize the benefit of thermochemistry MCQs, students should:

- Attempt a variety of questions regularly: This builds familiarity with different problem types.
- Review explanations thoroughly: Understanding why an answer is correct or incorrect deepens conceptual grasp.
- Identify weak areas: Focus on topics where mistakes or uncertainties occur.
- Mix conceptual and calculation questions: Balance helps develop both understanding and computational skills.
- Simulate exam conditions: Practice under timed settings to improve performance during actual tests.

QuestionAnswer Which of the following best describes an exothermic reaction in thermochemistry? An exothermic reaction releases heat to the surroundings, resulting in a negative ΔH value. In a calorimetry experiment, if 50 g of water absorbs 500 J of heat, what is the change in temperature? (Specific heat capacity of water = $4.18 \text{ J/g}^\circ\text{C}$) $\Delta T = 500 \text{ J} / (50 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C})$?

2.39°C Which statement is true about standard enthalpy of formation (ΔH_f°)? It is the change in enthalpy when one mole of a compound is formed from its elements in their standard states. Given the reaction: $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$, which of the following indicates an exothermic process? A negative ΔH for the reaction, indicating heat is released during ammonia formation. How does increasing temperature generally affect the spontaneity of an endothermic reaction? Increasing temperature can make an endothermic reaction more spontaneous if ΔS increases, considering $\Delta G = \Delta H - T\Delta S$. What is the primary purpose of Hess's Law in thermochemistry calculations? To determine the overall enthalpy change for a reaction by combining multiple thermochemical equations. In a reaction with $\Delta H = +100 \text{ kJ}$ and $\Delta S = +200 \text{ J/K}$, at what temperature would the reaction become spontaneous? When $\Delta G = 0$, $T = \Delta H / \Delta S = (100,000 \text{ J}) / (200 \text{ J/K}) = 500 \text{ K}$. Which of the following is NOT a standard condition for thermochemical measurements? A standard temperature of 25°C (298 K) and 1 atm pressure. If a reaction has an enthalpy change of $\Delta H = -50 \text{ kJ}$ and an entropy change of $\Delta S = 150 \text{ J/K}$, at what temperature does it become non-spontaneous? The reaction becomes non-spontaneous when $\Delta G > 0$; $T = \Delta H / \Delta S = (-50,000 \text{ J}) / (150 \text{ J/K}) = -333.33 \text{ K}$, which is physically meaningless, so it remains spontaneous at all positive temperatures. Which of the following best explains the concept of heat capacity in thermochemistry? Heat capacity is the amount of heat required to raise the temperature of a substance by 1°C or 1 K .
