Fundamental Principles of HPLC

At its core, HPLC relies on differential interactions between analytes, the stationary phase, and the mobile phase. When a mixture is injected into the system, each component interacts uniquely with the stationary phase, leading to distinct retention times. Components with stronger interactions elute later, allowing for effective separation.

Key points include:

- Partitioning: Separation based on differential distribution between mobile and stationary phases.
- Adsorption: Components adsorb onto the stationary phase surface variably.
- Size Exclusion: Larger molecules are excluded from pores in the stationary phase.

Differentiation measures how a function changes at a point. The derivative $f'(x)$ indicates the slope of the tangent line to the graph of f .

Integration

Integration accumulates quantities such as area under a curve. The definite integral $\int_a^b f(x) dx$ computes the accumulation of f from a to b .

Sequences and Series

- Sequences: Ordered lists of numbers that approach a limit.
- Series: Sum of the terms of a sequence. Convergence or divergence of series is a central topic in analysis.

Key Theorems and Principles

Several fundamental theorems form the backbone of analysis, providing tools for understanding and solving problems.

Limit Theorems

- Squeeze Theorem: If $f(x) \leq g(x) \leq h(x)$ near a point and $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$, then $\lim_{x \rightarrow c} g(x) = L$.

Continuity Theorems

- Intermediate Value Theorem: If f is continuous on $[a, b]$ and d is between $f(a)$ and $f(b)$, then there exists $c \in [a, b]$ such that $f(c) = d$.
