Understanding Signals and Systems

What Are Signals?

Signals are functions that convey information about the behavior or attributes of some phenomenon. They are fundamental in engineering, representing data such as sound, images, or other physical quantities. Signals can be classified based on various criteria:

- Analog Signals: Continuous signals that vary smoothly over time (e.g., human voice, temperature readings).
- Digital Signals: Discrete signals represented by binary values, suitable for digital processing.
- Periodic Signals: Repeat at regular intervals over time.
- Aperiodic Signals: Do not exhibit regular repetition.

What Are Systems?

Systems are processes or devices that manipulate signals, transforming input signals into output signals. Examples include filters, amplifiers, modulators, and communication channels. Systems can be characterized by their properties:

- Linearity: The system's response to a sum of inputs is the sum of responses.
- Time-Invariance: System properties do not change over time.
- Causality: Output depends only on current and past inputs.
- Stability: Bounded inputs produce bounded outputs.
