Understanding Vertebrate and Invertebrate Animals

What Are Vertebrates?

Vertebrates are animals characterized by having a backbone or spinal column. They belong to the subphylum Vertebrata within the phylum Chordata. Vertebrates are highly diverse and include species such as:

- Mammals (e.g., humans, elephants, whales)
- Birds (e.g., eagles, sparrows)
- Fish (e.g., salmon, sharks)
- Amphibians (e.g., frogs, salamanders)
- Reptiles (e.g., snakes, lizards)

These animals typically have more complex physiologies, advanced nervous systems, and are often larger in size compared to invertebrates.

What Are Invertebrates?

In contrast, invertebrates lack a backbone. They constitute the majority of animal species, making up about 97% of all animals on Earth. Examples include:

- Insects (e.g., ants, butterflies)
- Mollusks (e.g., snails, octopuses)

- Crustaceans (e.g., crabs, lobsters)
- Worms (e.g., earthworms, flatworms)
- Echinoderms (e.g., starfish, sea urchins)

Invertebrates often display incredible diversity in form, size, and habitat, ranging from microscopic creatures to large marine animals.
