Review answer:

- Empirical formula provides the simplest ratio; molecular formula shows the actual number of atoms.

Reviewing Key Vocabulary with Practice Questions and Answers

To reinforce understanding, let's review some typical questions and their answers related to chemical quantities.

1. How do you determine the molar mass of a compound?

Answer:

Sum the atomic masses of all atoms in the molecular or formula unit. For example, for water (H₂O):

- Hydrogen: 1.008 g/mol
- Oxygen: 16.00 g/mol
- Molar mass of H₂O = (2 x 1.008) + 16.00 = 18.016 g/mol

2. What is the significance of Avogadro's number?

Answer:

It provides a link between the microscopic scale (particles) and the macroscopic scale (grams, liters). One mole of any substance contains 6.022×10^{23} particles.

3. How do you calculate the number of moles from mass?

Answer:

Use the formula:

$$\text{Moles} = \frac{\text{Mass (g)}}{\text{Molar mass (g/mol)}}$$

4. How is molarity defined? Provide the formula.

Answer:

Molarity (M) = moles of solute / liters of solution.

$$M = \frac{\text{moles of solute}}{\text{volume of solution in liters}}$$

5. How do you find the empirical formula of a compound?

Answer:

- Convert the mass of each element to moles.
- Divide each mole value by the smallest number of moles.
- Round to the nearest whole number ratio.
- Write the empirical formula based on these ratios.

Common Calculations Using Chemical Quantities Vocabulary

1. Converting between mass and moles

$$\text{Number of particles} = \text{moles} \times 6.022 \times 10^{23}$$

3. Determining concentration

- For molarity: divide moles of solute by liters of solution.
- For mass percent: divide the mass of solute by the total mass of solution and multiply by 100.

Common Mistakes and Tips in Chemical Quantities Vocabulary

- Always double-check units when performing calculations.
