Question What are the fundamental data structures covered in typical data structures lecture notes? Common fundamental data structures include arrays, linked lists, stacks, queues, trees, graphs, hash tables, and heaps. These form the basis for understanding more complex structures and algorithms. How do I choose the appropriate data structure for my problem? Choosing the right data structure depends on the problem requirements such as data size, operation frequency (insertions, deletions, searches), and performance constraints. Lecture notes

often emphasize analyzing time and space complexity to make an informed choice. What is the difference between an array and a linked list? An array is a fixed-size, contiguous block of memory allowing constant-time access via indices, while a linked list consists of nodes connected by pointers, enabling dynamic memory allocation and efficient insertions/deletions but with sequential access. Can you explain the concept of a binary tree and its applications? A binary tree is a hierarchical data structure where each node has at most two children. Applications include searching (binary search trees), sorting (heaps), and representing hierarchical data like file systems. What are hash tables and how do they work?
